An operator in the Woodford Shale had a well that was flowing steadily, but was only producing 150 Mcfd of gas.

The operator wanted better production results, so he contacted PCS Ferguson to try a different solution.

PCS Ferguson assessed the well and determined to use the First Responder plunger, consisting of a 9” sleeve and a Tungsten ball combination.

Immediately after the two-piece plunger was installed, the well achieved significant results.

Once PCS Ferguson installed the First Responder plunger, the well had a production increase of 233%, reaching 500 Mcfd of gas! The well has had a steady production level since October 2017.
