An operator in the Woodford Shale had a well that was difficult to produce. He tried swabbing the well in December 2016, but had had little success.

The well produced fluids inconsistently and was logged off more than it was flowing.

To achieve better, more consistent results, the operator contacted PCS Ferguson to install a Plunger Lift System.

PCS Ferguson installed a Plunger Lift System in January 2017 that included the 2 3/8” Super Seal Pad Plunger.

Since January 2017, The PCS Ferguson Plunger Lift System with the Super Seal Pad Plunger achieved successful results. The well consistently produced 200 Mcfd of gas.
